- CartoDB. Software español para representación visual de datos geográficos.
- Guice. Framework de inyección de dependencias en Java.
- swift-nio. Framework asíncrono de entrada-salida en Swift.
- Spring Boot. Framework web en Java
- Swift. Compilador y librería stándar de Swift. Escrito en C++ y Swift.

2. Metáforas

metáfora.

(Del lat. *metaphŏra,* y este del gr. μεταφορά, traslación).

1. f. *Ret.* Tropo que consiste en trasladar el sentido recto de las voces a otro figurado, en virtud de una comparación tácita; p. ej., *Las perlas del rocío. La primavera de la vida. Refrenar las pasiones.*

2. f. Aplicación de una palabra o de una expresión a un objeto o a un concepto, al cual no denota literalmente, con el fin de sugerir una comparación (con otro objeto o concepto) y facilitar su comprensión; p. ej., *el átomo es un sistema solar en miniatura.*

~ continuada.

1. f. *Ret.* Alegoría en que unas palabras se toman en sentido recto y otras en sentido figurado.

"Hemos ganado este combate"
"Nos lo jugamos todo en esta campaña"
"Es una oportunidad de vida o muerte"

Vs.

"Hemos coreografiado perfectamente la puesta en marcha del producto"
"Todos debemos participar en este viaje"
"Nuestro ecosistema premia la lealtad de nuestros clientes"

The New Methodology

In the past few years there's been a blossoming of a new style of software methodology - referred to as agile methods. Alternatively characterized as an antidote to bureaucracy or a license to hack they've stirred up interest all over the software landscape. In this essay I explore the reasons for agile methods, focusing not so much on their weight but on their adaptive nature and their people-first orientation.

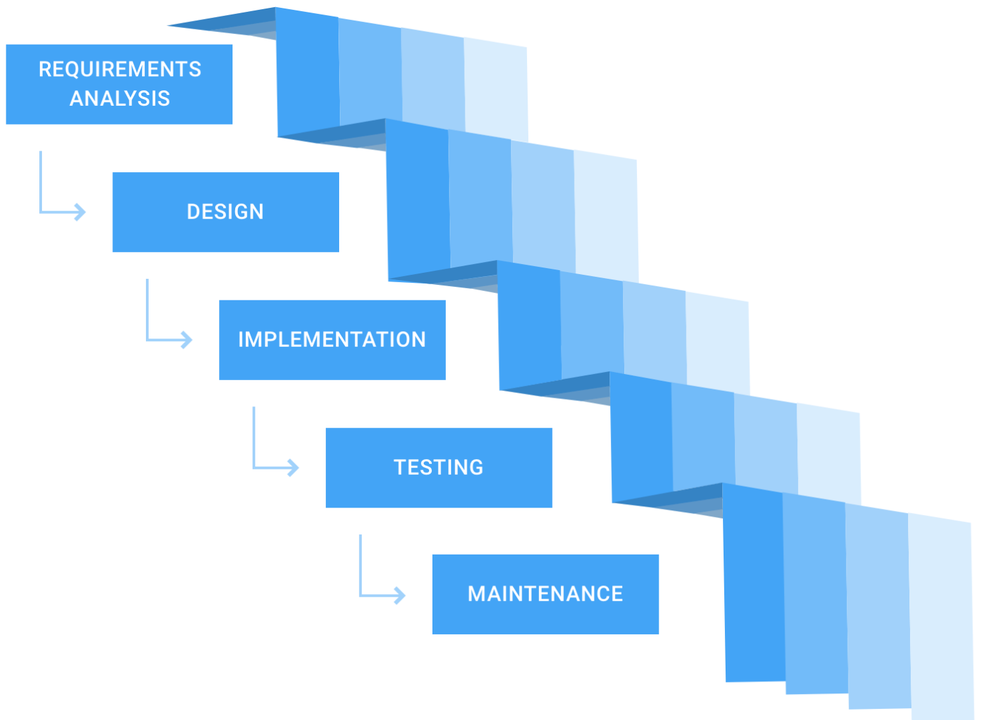
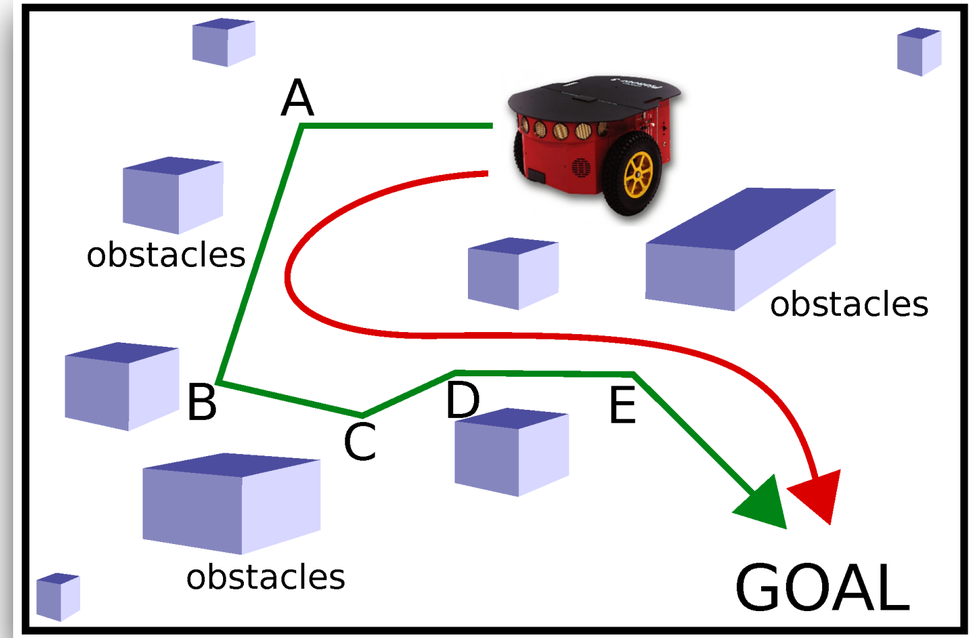
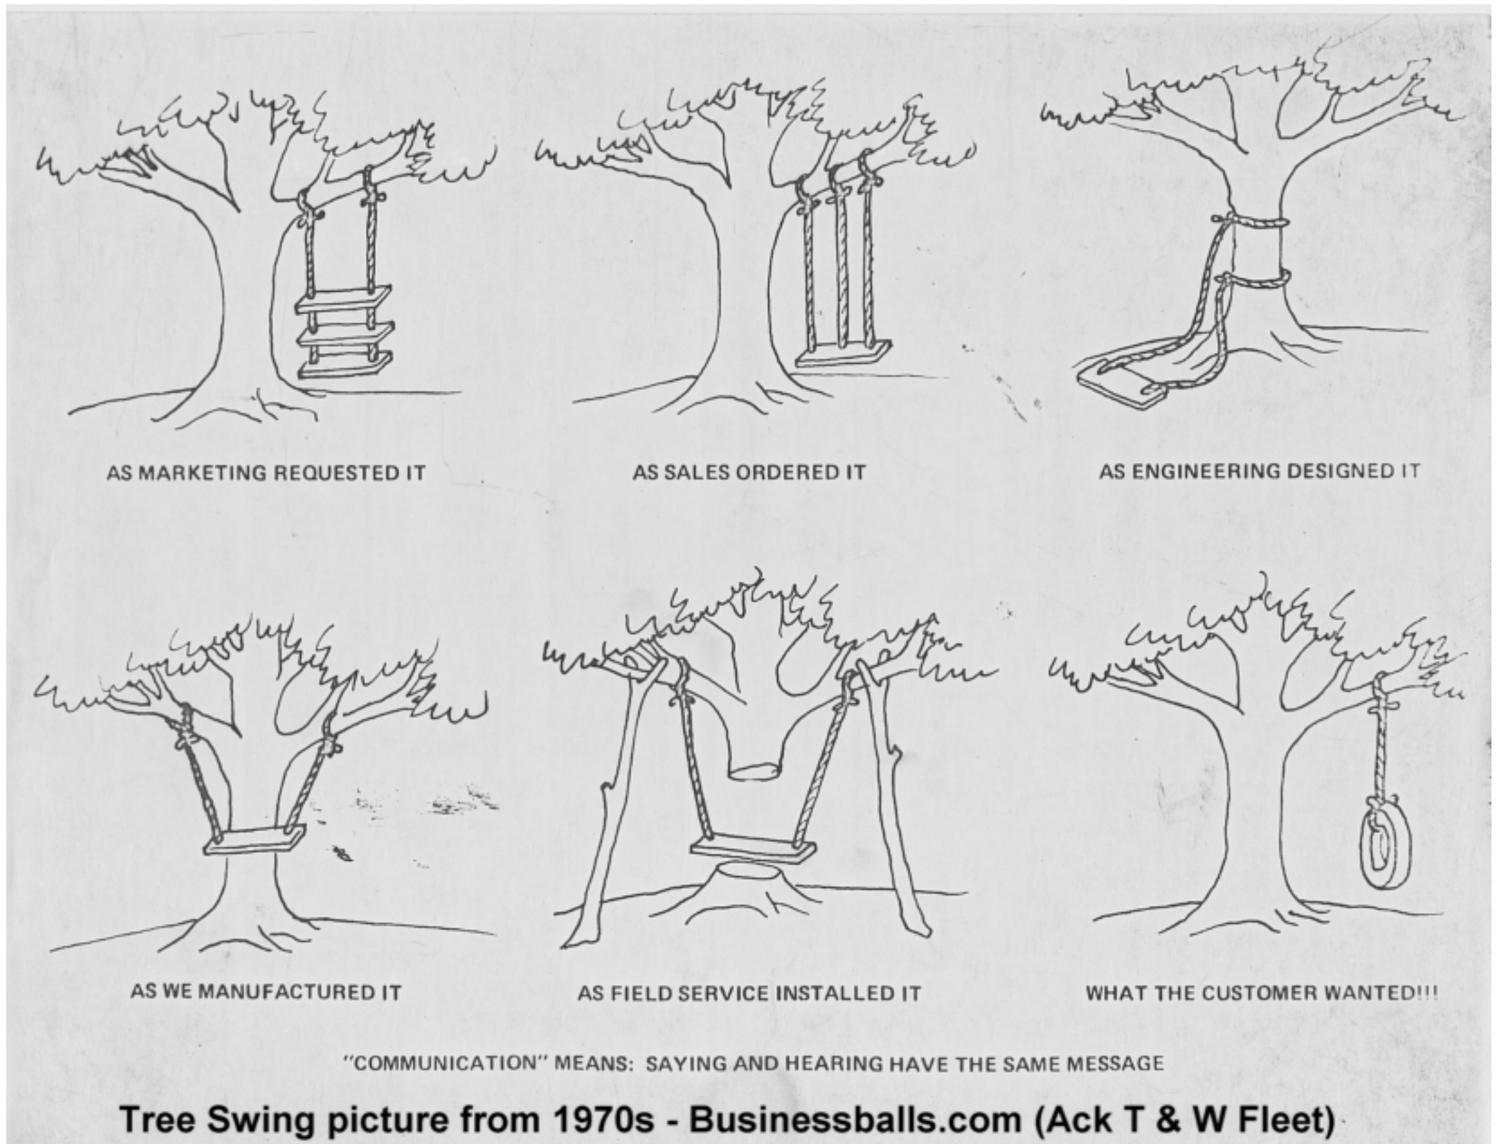
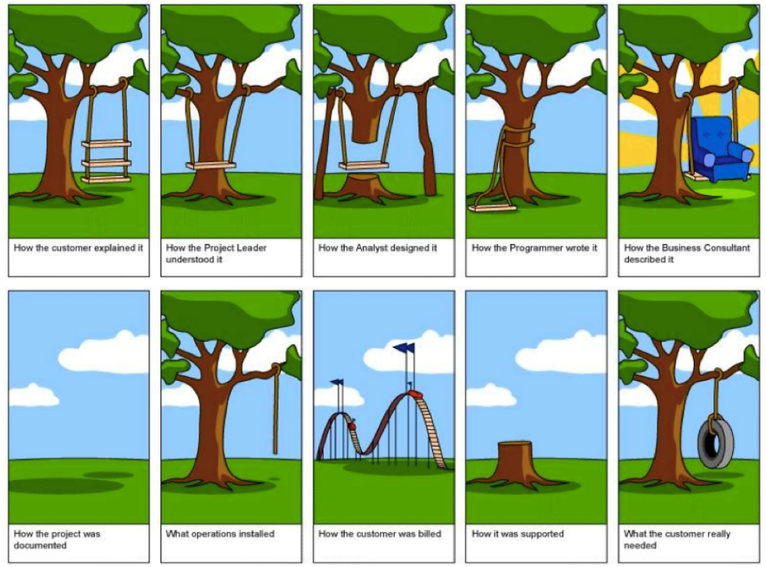
Waterfall Model



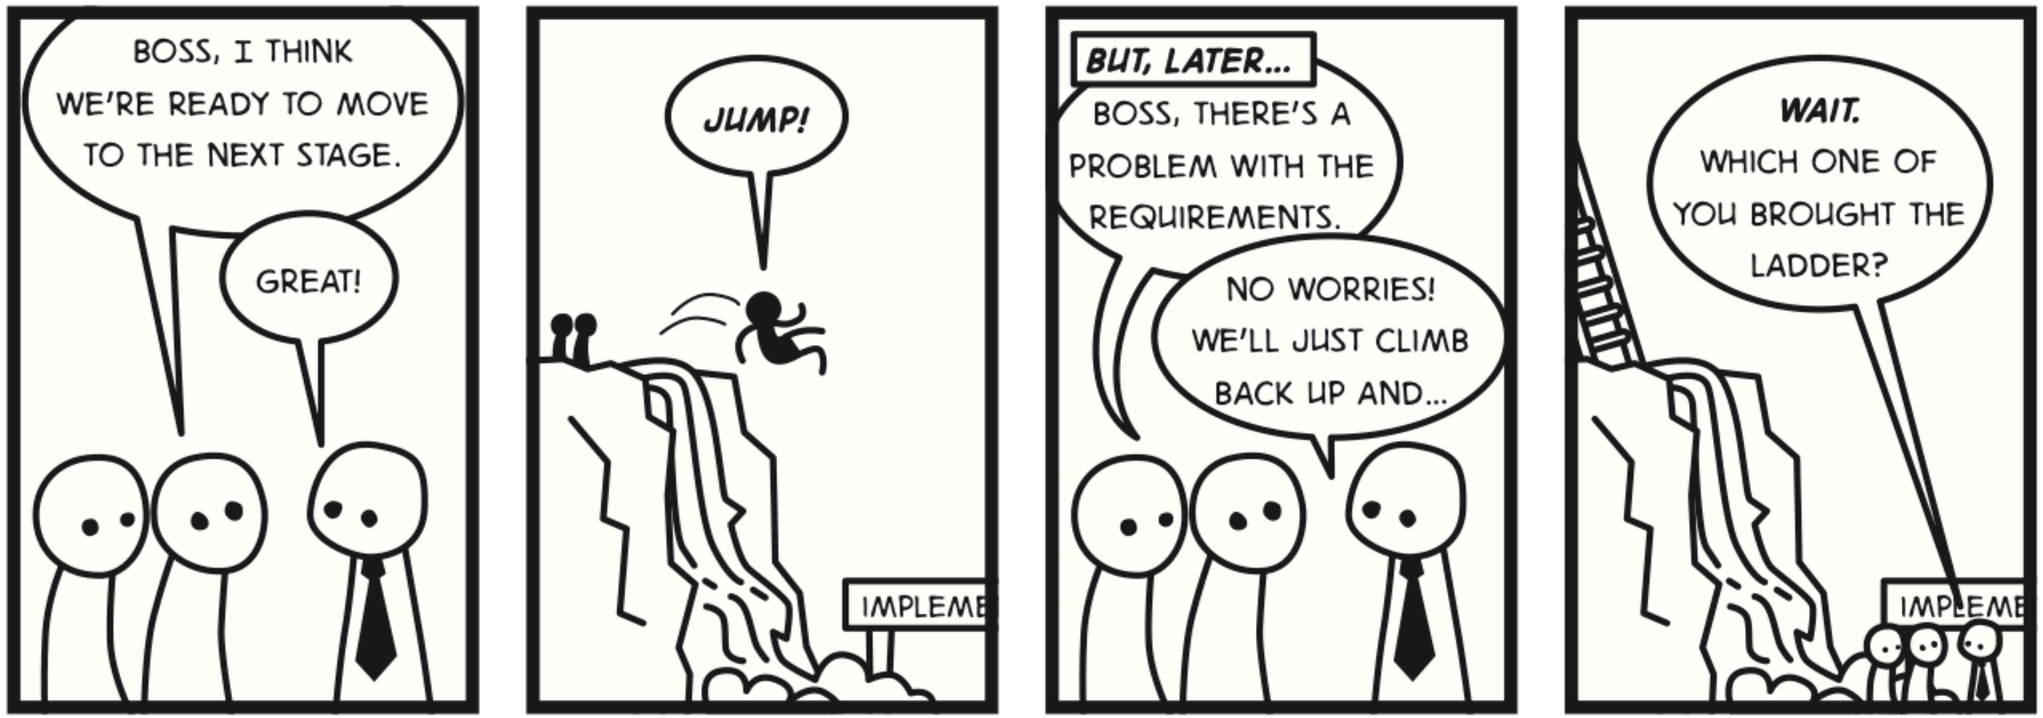




AS MARKETING REQUESTED IT
AS SALES ORDERED IT
AS ENGINEERING DESIGNED IT
AS WE MANUFACTURED IT
AS FIELD SERVICE INSTALLED IT
WHAT THE CUSTOMER WANTED!!!
"COMMUNICATION" MEANS: SAYING AND HEARING HAVE THE SAME MESSAGE
Tree Swing picture from 1970s - Businessballs.com (Ack T & W Fleet)



How the customer explained it
How the Project Leader understood it
How the Analyst designed it
How the Programmer wrote it
How the Business Consultant described it
How the project was documented
What operations installed
How the customer was billed
How it was supported
What the customer really needed

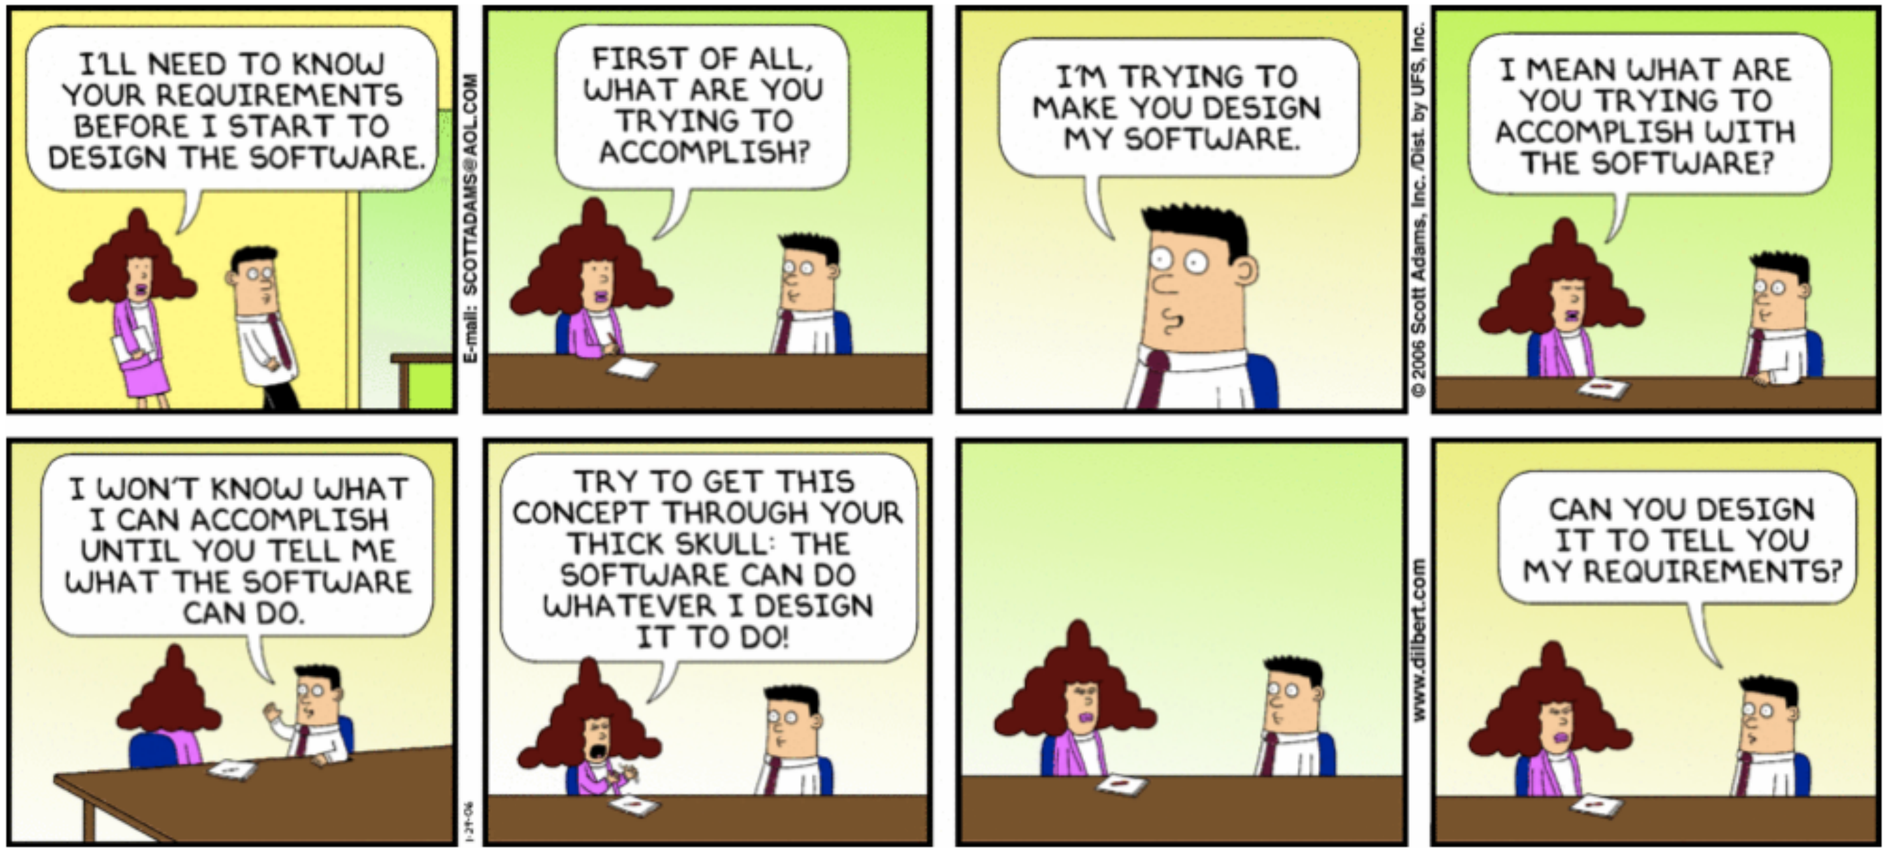


BOSS, I THINK WE'RE READY TO MOVE TO THE NEXT STAGE.
GREAT!
JUMP!
IMPLEME
BUT, LATER...
BOSS, THERE'S A PROBLEM WITH THE REQUIREMENTS.
NO WORRIES! WE'LL JUST CLIMB BACK UP AND...
WAIT.
WHICH ONE OF YOU BROUGHT THE LADDER?
IMPLEME

No es una ingeniería tradicional

- En el software la parte de construcción es muy barata.
- En el software todo el esfuerzo es diseño y requiere, por tanto, de personas creativas y con talento.
- Los procesos creativos no se pueden planificar fácilmente, por lo que la predictividad es un objetivo imposible.

¿Los requisitos son predecibles?



- **Lo que nos gustaría**
  - Los clientes saben lo que quieren
  - El equipo sabe cómo construirlo
  - Nada cambiará en el camino
  - Tenemos mucho tiempo y dinero para hacerlo
- **La realidad**
  - Los clientes descubren lo que necesitan
  - Los desarrolladores descubren cómo hacerlo
  - Muchas cosas cambian en el camino
  - Siempre hay más cosas qué hacer que tiempo y dinero disponible

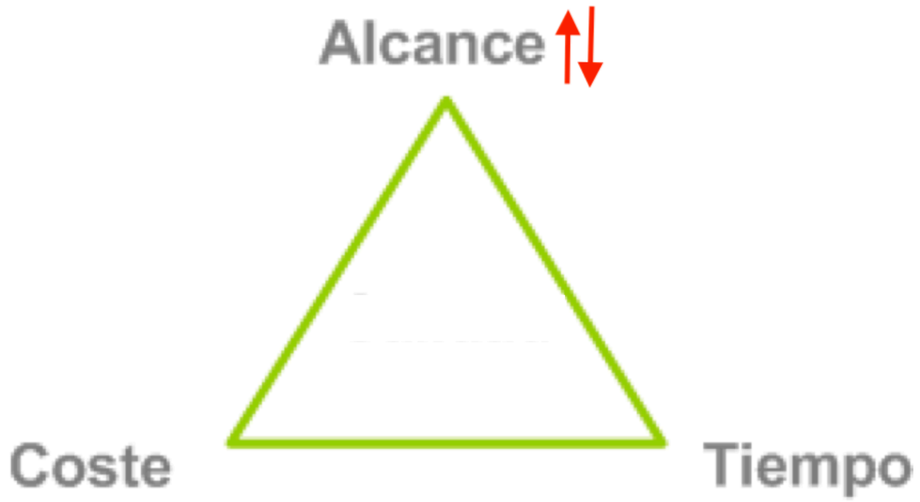
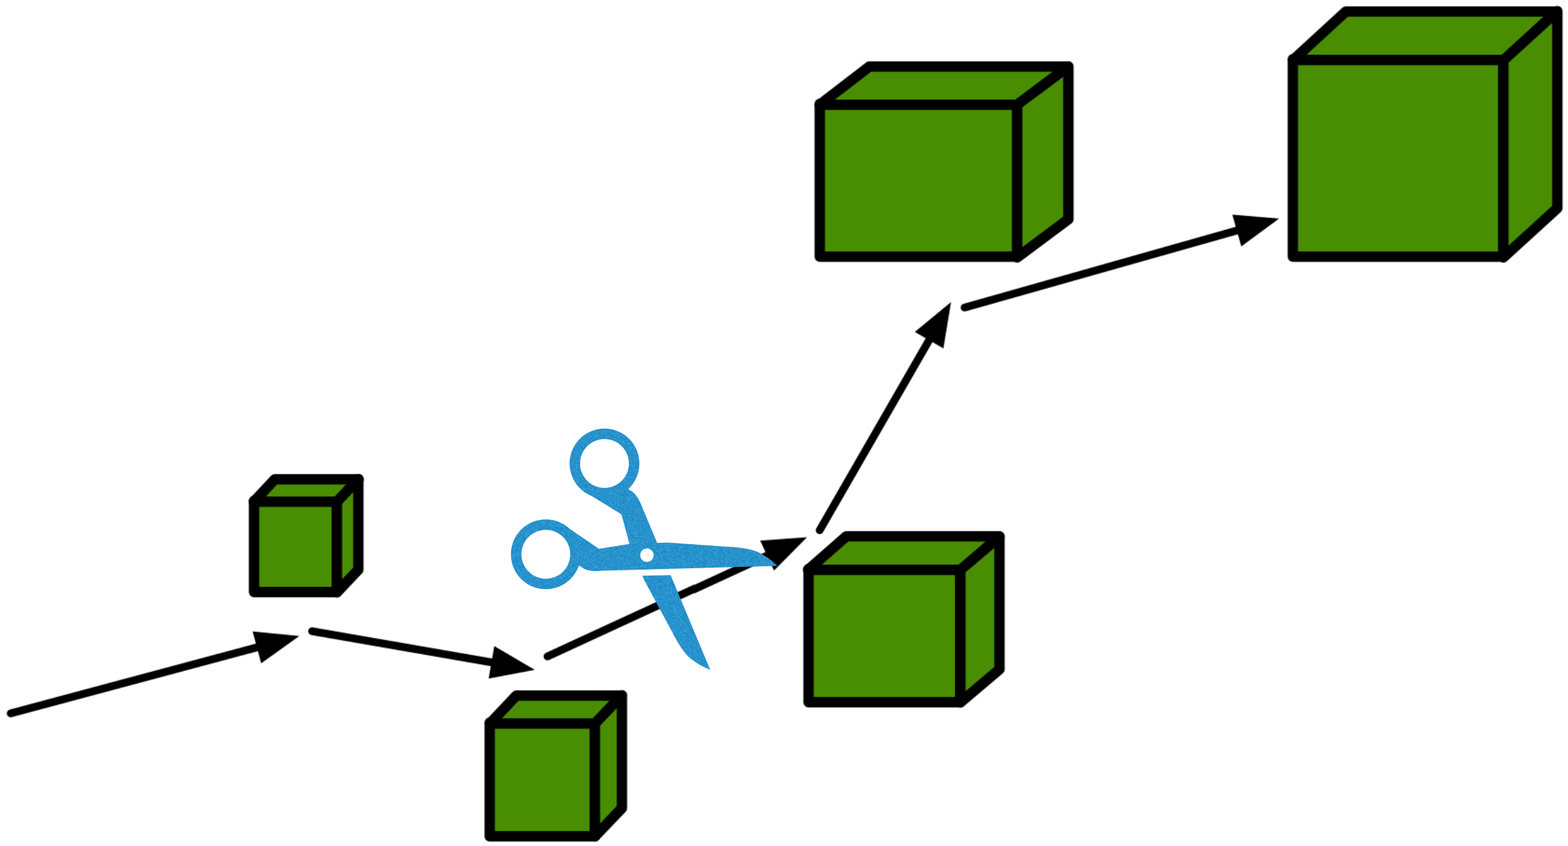
Contratos ágiles

- **Contrato tradicional**: precio fijo, el cliente paga al final por unos requisitos en un plazo. Si se incumple el plazo o los requisitos el cliente puede no pagar y la empresa de software no entrega nada.

- **Contrato ágil**: presupuesto fijo, se paga a intervalos establecidos y la empresa de software entrega periódicamente el producto. Cualquiera de los dos puede cancelar el contrato en cualquier momento.

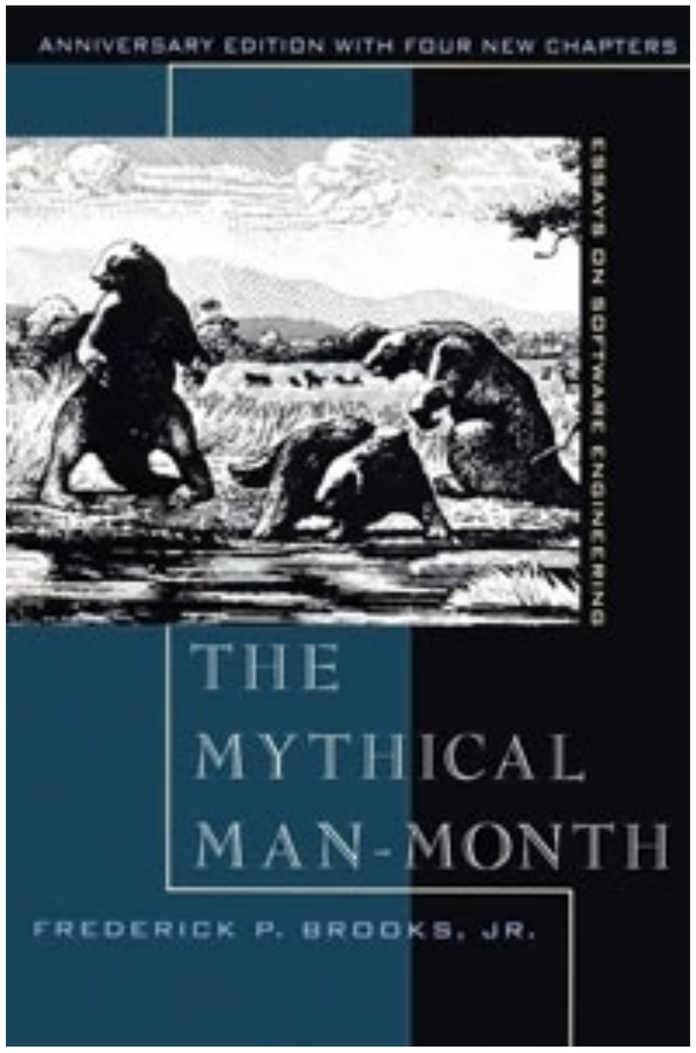




"*Un cambio de última hora en los requerimientos es una ventaja competitiva.*"

Mary Poppendieck

4. El desarrollo de software es una actividad creativa



1975

"Adding manpower to a late software project makes it later."

Fred Brooks

No Silver Bullet

Essence and Accidents of Software Engineering

Frederick P. Brooks, Jr.
University of North Carolina at Chapel Hill

Fashioning complex conceptual constructs is the *essence;* *accidental* tasks arise in representing the constructs in language. Past progress has so reduced the accidental tasks that future progress now depends upon addressing the essence.

Of all the monsters that fill the nightmares of our folklore, none terrify more than werewolves, because they transform unexpectedly from the familiar into horrors. For these, one seeks bullets of silver that can magically lay them to rest.

The familiar software project, at least as seen by the nontechnical manager, has something of this character; it is usually innocent and straightforward, but is capable of becoming a monster of missed schedules, blown budgets, and flawed products. So we hear desperate cries for a silver bullet—something to make software costs drop as rapidly as computer hardware costs do.

But, as we look to the horizon of a decade hence, we see no silver bullet. There is no single development, in either technology or in management technique, that by itself promises even one order-of-magnitude improvement in productivity, in reliability, in simplicity. In this article, I shall try to show why, by examining both the nature of the software problem and the properties of the bullets proposed.

Skepticism is not pessimism, however. Although we see no startling breakthroughs—and indeed, I believe such to be inconsistent with the nature of software—many encouraging innovations are under way. A disciplined, consistent effort to develop, propagate, and exploit these innovations should indeed yield an order-of-magnitude improvement. There is no royal road, but there is a road.

The first step toward the management of disease was replacement of demon theories and humours theories by the germ theory. That very step, the beginning of hope, in itself dashed all hopes of magical solutions. It told workers that progress would be made stepwise, at great effort, and that a persistent, unremitting care would have to be paid to a discipline of cleanliness. So it is with software engineering today.

This article was first published in *Information Processing '86,* ISBN No. 0-444-70077-3, H.-J. Kugler, ed., Elsevier Science Publishers B.V. (North-Holland) © IFIP 1986.

Does it have to be hard?—Essential difficulties

Not only are there no silver bullets now in view, the very nature of software makes it unlikely that there will be any—no inventions that will do for software productivity, reliability, and simplicity what electronics, transistors, and large-scale integration did for computer hardware.

Desarrollo de software

Veremos en este apartado las características propias del software y de la forma de desarrollarlo q
comparar con ingenierías tradicionales como la construcción.

Software

El software es un invento muy reciente de la humanidad. Fue a mitad del siglo XX cuando se empe
computadores electrónicos programables en organismos oficiales y grandes empresas. Y los prim
